INSTRUCTIONS
• Use black ink. You may use an HB pencil for graphs and diagrams.
• Complete the boxes above with your name, centre number and candidate number.
• Answer all the questions.
• Write your answer to each question in the space provided.
• Additional paper may be used if required but you must clearly show your candidate number, centre number and question number(s).
• Do not write in the bar codes.

INFORMATION
• The total mark for this paper is 70.
• The marks for each question are shown in brackets [ ].
• Quality of extended responses will be assessed in questions marked with an asterisk (*).
• This document consists of 20 pages.
Answer all the questions.

1. Give chemical explanations for the following statements.

(a) Bromine has a higher boiling point than chlorine.

........................................................................................................................................
........................................................................................................................................ [1]

(b) A carton of milk expands on freezing.

........................................................................................................................................
........................................................................................................................................ [1]

(c) Potassium is placed immediately after argon in the periodic table.

........................................................................................................................................
........................................................................................................................................ [1]

(d) The reaction of ethane with chlorine under UV radiation is a poor method for preparing a high yield of chloroethane.

........................................................................................................................................
........................................................................................................................................ [1]

(e) Water has a concentration of approximately 5.6 mol dm$^{-3}$.

........................................................................................................................................
........................................................................................................................................ [1]

(f) The carbon–carbon bonds in benzene are all the same length.

........................................................................................................................................
........................................................................................................................................ [1]
(g) IR spectroscopy distinguishes ketones from carboxylic acids.

................................................................................................................................................. [1]

................................................................................................................................................. [1]

(h) 1.323 g of N₂O(g) has a volume of 1.00 dm³ at 100 kPa and 400 K.

................................................................................................................................................. [1]

................................................................................................................................................. [1]

(i) 4.25 g of C₆H₅COOCH₃ contains 1.88 × 10²² molecules.

................................................................................................................................................. [1]

................................................................................................................................................. [1]

(j) The rate of hydrolysis of 1-bromobutane is faster than that of 1-chlorobutane.

................................................................................................................................................. [1]

................................................................................................................................................. [1]
2 This question looks at ions and complexes.

(a) You are provided with two boiling tubes containing solutions of the same ionic compound. The compound contains one cation and one anion from the lists below.
- cations: Fe$^{2+}$, Mn$^{2+}$, NH$_4^+$
- anions: Cl$^-$, CO$_3^{2-}$, SO$_4^{2-}$

Solutions of common laboratory reagents are available.

Plan a series of tests that you could carry out on the samples to identify the ionic compound. Your tests should produce at least one positive result for each ion.

For each test,
- include details of reagents, relevant observations and equations
- explain how your observations allow the ions to be identified.

You may include flowcharts or tables in your answer.
(b) The dissociation of water is measured by the ionic product of water, $K_w$. The value of $K_w$ varies with temperature as shown in the graph below.

Calculate the pH of water at body temperature, 37 °C.

$$pH = \text{…………………}$$
(c) A complex of cobalt has the following composition by mass:

Co, 21.98%; N, 31.35%; H, 6.72%; Cl, 39.75%

(i) Calculate the empirical formula of this complex.

empirical formula = .................................................. [2]

(ii) The formula of this cobalt complex can be expressed in form $[\text{Co(}L_m\text{)}^{n+}(\text{Cl}^-)_n$

Suggest the chemical formula of $[\text{Co(}L_m\text{)}^{n+}$.

............................................................................................................. [1]
This question looks at properties of iron compounds and iron ions in different oxidation states.

(a) $\text{Fe}^{2+}$ and $\text{Fe}^{3+}$ are the most common ions of iron.

(i) Write the electron configuration, in terms of sub-shells, for the $\text{Fe}^{2+}$ ion.

(ii) How many orbitals contain an unpaired electron in an ion of $\text{Fe}^{2+}$?

(b) $[\text{Fe(H}_2\text{O)}_{6}]^{3+}$ ions take part in ligand substitution reactions.

An excess of aqueous potassium cyanide, KCN(aq), is added to an aqueous solution containing $[\text{Fe(H}_2\text{O)}_{6}]^{3+}$ ions. A ligand substitution reaction takes place forming a complex ion that has a molar mass of 211.8 g mol$^{-1}$.

Write an equation for this ligand substitution reaction.

(c) The complex ion, $[\text{Fe(H}_2\text{O)}_{6}]^{3+}$, behaves as a weak Bronsted–Lowry acid in aqueous solution. The equation below represents the dissociation of aqueous $[\text{Fe(H}_2\text{O)}_{6}]^{3+}$ ions, together with the $K_a$ value.

\[
[\text{Fe(H}_2\text{O)}_{6}]^{3+}(\text{aq}) \rightleftharpoons [\text{Fe(H}_2\text{O)}_{5}\text{OH}]^{2+}(\text{aq}) + \text{H}^+(\text{aq}) \quad K_a = 6.00 \times 10^{-3} \text{ mol dm}^{-3}
\]

(i) Write the expression for the acid dissociation constant, $K_a$, for $[\text{Fe(H}_2\text{O)}_{6}]^{3+}$.

(ii) Calculate the pH of a 0.100 mol dm$^{-3}$ solution of $[\text{Fe(H}_2\text{O)}_{6}]^{3+}$ to two decimal places.

\[
\text{pH} = \text{...} \quad [2]
\]
(d) Fe$_2$O$_3$ can be oxidised by ClO$^-$ ions under alkaline conditions in a redox reaction.

Unbalanced half-equations for this reaction are shown below.

Balance the half-equations and construct an overall equation for the reaction.

\[
\text{……. ClO}^- + \text{……. H}_2\text{O} + \text{……. e}^- \rightarrow \text{……. Cl}^- + \text{……. OH}^- \\
\text{……. Fe}_2\text{O}_3 + \text{……. OH}^- \rightarrow \text{……. FeO}_4^{2-} + \text{……. H}_2\text{O} + \text{……. e}^- \\
\]

overall equation: ........................................................................................................ [3]
Methanoic acid and bromine react as in the equation below.

$$\text{Br}_2(\text{aq}) + \text{HCOOH}(\text{aq}) \rightarrow 2\text{H}^+(\text{aq}) + 2\text{Br}^-(\text{aq}) + \text{CO}_2(\text{g})$$

A student investigates the rate of this reaction by monitoring the concentration of bromine over time. The student uses a large excess of HCOOH to ensure that the order with respect to HCOOH will be effectively zero.

From the experimental results, the student plots the graph below.

(a) Suggest how the concentration of the bromine could have been monitored.
(b) Suggest a different experimental method that would allow the rate of this reaction to be followed over time.

.................................................................................................................................................. [1]

..................................................................................................................................................

(c) Why would use of excess HCOOH ensure that the order with respect to HCOOH is effectively zero?

.................................................................................................................................................. [1]

..................................................................................................................................................

(d)* Using the graph, determine
- the initial rate of reaction
- the rate constant.

Your answer must show full working using the graph and the lines below as appropriate.

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

.................................................................................................................................................. [6]
5 This question is about organic acids.

(a) Lactic acid, shown below, has two functional groups.

![Lactic acid structure]

Lactic acid reacts with bases and with many metals.
- An aqueous solution containing 1.125 g of lactic acid is reacted with an excess of magnesium producing hydrogen gas.
- The excess magnesium is removed.
  The water is evaporated, leaving a white solid, A.

(i) Name the type of reaction of lactic acid with bases and with metals.

reaction with bases: .................................................................

reaction with metals: ...............................................................

(ii) Calculate the volume of H$_2$(g) produced, measured at room temperature and pressure.

volume of H$_2$ = .................................................................

(iii) What is the empirical formula of the white solid A?
(iv) Predict two reactions of lactic acid, each involving a different functional group.

Do not include reactions with bases or metals.

For each reaction,
- state the type of reaction, the reagents and conditions
- draw the structures of any organic products formed.
(b) In basic conditions, α-amino acids form anions with the general formula, \( R\text{CH(NH}_2\text{)COO}^- \). These anions can act as bidentate ligands.

Copper(II) ions can form a square planar complex with anions of the amino acid glycine (\( R = \text{H} \)). There are two stereoisomers of this complex, \( \text{B} \) and \( \text{C} \).

(i) Draw the **skeletal** formula of the anion of glycine.

(ii) Draw diagrams of stereoisomers \( \text{B} \) and \( \text{C} \).

In your structures, show the ligands as skeletal formulae.

(iii) Anion ligands of the amino acid alanine (\( R = \text{CH}_3 \)) would be expected to form more than two square planar stereoisomers with copper(II) ions.

Explain this statement.

.................................

.................................
(c) Methanoic acid is added to water. An acid–base equilibrium is set up containing two acid–base pairs.

Suggest a mechanism for the forward reaction in this equilibrium.

Your mechanism should use displayed formulae and curly arrows, and show all species present at equilibrium.
(d) Information about a monobasic organic acid D is shown below.

- D reacts by both electrophilic substitution and electrophilic addition.
- The molecular formula of D is C\_xH\_yO\_2.
- The mass spectrum of D has a molecular ion peak at m/z = 148.
- The \(^{13}\)C NMR spectrum of D contains seven peaks.

Determine and draw a possible structure for D.

Explain your reasoning from the evidence provided.
6 Hydroxylamine, NH$_2$OH, is a strong reducing agent.

When heated in aqueous solution, NH$_2$OH reduces Fe$^{3+}$ ions to Fe$^{2+}$ ions.

A student suggests the three possible equations for the reaction, shown below.

**Equation 1**  
NH$_2$OH + Fe$^{3+}$ $\rightarrow$ Fe$^{2+}$ + $\frac{1}{2}$N$_2$ + H$^+$ + H$_2$O

**Equation 2**  
NH$_2$OH + 2Fe$^{3+}$ $\rightarrow$ 2Fe$^{2+}$ + $\frac{1}{2}$N$_2$O + 2H$^+$ + $\frac{1}{2}$H$_2$O

**Equation 3**  
NH$_2$OH + 3Fe$^{3+}$ $\rightarrow$ 3Fe$^{2+}$ + NO + 3H$^+$

The student plans to carry out an investigation to determine which equation is correct.

The method is outlined below.

**Stage 1**  
Using a pipette, add 25.0 cm$^3$ of $4.32 \times 10^{-2}$ mol dm$^{-3}$ NH$_2$OH to a conical flask. Add 10 cm$^3$ of 1 mol dm$^{-3}$ H$_2$SO$_4$ to the conical flask followed by an excess of a solution containing 0.0400 mol dm$^{-3}$ Fe$^{3+}$(aq).

**Stage 2**  
Boil the mixture for 5 minutes and allow to cool.

**Stage 3**  
Titrate the cooled mixture with $2.00 \times 10^{-2}$ mol dm$^{-3}$ KMnO$_4$(aq).

(a) Determine the minimum volume of 0.0400 mol dm$^{-3}$ Fe$^{3+}$(aq) that the student should plan to use in **Stage 1**.

Explain your reasoning.

volume = ................................ cm$^3$

explanation: ........................................................................................................

........................................................................................................

........................................................................................................
(b) In the student’s titration, 21.6 cm$^3$ of KMnO$_4$(aq) is required to reach the end point.

The equation that takes place during the titration is shown below.

\[
\text{MnO}_4^-(aq) + 8\text{H}^+(aq) + 5\text{Fe}^{2+}(aq) \rightarrow \text{Mn}^{2+}(aq) + 5\text{Fe}^{3+}(aq) + 4\text{H}_2\text{O}(l)
\]

Analyse the student’s results to determine which of the three equations is correct.

Show all your working.

(c) The student intends to repeat the procedure to check their results.

There is insufficient time for the student to repeat all three stages and the student decides to omit Stage 2, the boiling stage. Unfortunately the resulting titre is much less than the original titre.

The student rejects the results from the repeated procedure.

(i) Suggest the purpose of the boiling in Stage 2 and reasons for the second titre being much less than the original titre.

.................................................................
.................................................................
.................................................................
.................................................................
.................................................................
.................................................................

[2]
(ii) The main reason for insufficient time is the need to boil and cool the mixture for each titration.

Suggest how the procedure could be modified so that **Stage 2** does not need to be carried out repeatedly.

Give your reasoning.

........................................................................................................................................................................
........................................................................................................................................................................
........................................................................................................................................................................ [1]

END OF QUESTION PAPER
day June 20XX – Morning/Afternoon
A Level Chemistry A
H432/03 Unified chemistry

SAMPLE MARK SCHEME

MAXIMUM MARK 70

Duration: 1 hour 30 minutes

This document consists of 20 pages
MARKING INSTRUCTIONS

PREPARATION FOR MARKING

SCORIS

1. Make sure that you have accessed and completed the relevant training packages for on-screen marking: scoris assessor Online Training; OCR Essential Guide to Marking.

2. Make sure that you have read and understood the mark scheme and the question paper for this unit. These are posted on the RM Cambridge Assessment Support Portal http://www.rm.com/support/ca

3. Log-in to scoris and mark the required number of practice responses (“scripts”) and the required number of standardisation responses.

YOU MUST MARK 10 PRACTICE AND 10 STANDARDISATION RESPONSES BEFORE YOU CAN BE APPROVED TO MARK LIVE SCRIPTS.

MARKING

1. Mark strictly to the mark scheme.

2. Marks awarded must relate directly to the marking criteria.

3. The schedule of dates is very important. It is essential that you meet the scoris 50% and 100% (traditional 50% Batch 1 and 100% Batch 2) deadlines. If you experience problems, you must contact your Team Leader (Supervisor) without delay.

4. If you are in any doubt about applying the mark scheme, consult your Team Leader by telephone, email or via the scoris messaging system.
5. Work crossed out:
   a. where a candidate crosses out an answer and provides an alternative response, the crossed out response is not marked and gains no marks.
   b. if a candidate crosses out an answer to a whole question and makes no second attempt, and if the inclusion of the answer does not cause a rubric infringement, the assessor should attempt to mark the crossed out answer and award marks appropriately.

6. Always check the pages (and additional objects if present) at the end of the response in case any answers have been continued there. If the candidate has continued an answer there then add a tick to confirm that the work has been seen.

7. There is a NR (No Response) option. Award NR (No Response)
   - if there is nothing written at all in the answer space
   - OR if there is a comment which does not in any way relate to the question (e.g. ‘can’t do’, ‘don’t know’)
   - OR if there is a mark (e.g. a dash, a question mark) which isn’t an attempt at the question.

Note: Award 0 marks – for an attempt that earns no credit (including copying out the question).

8. The scoris comments box is used by your Team Leader to explain the marking of the practice responses. Please refer to these comments when checking your practice responses. Do not use the comments box for any other reason.

If you have any questions or comments for your Team Leader, use the phone, the scoris messaging system, or email.

9. Assistant Examiners will send a brief report on the performance of candidates to their Team Leader (Supervisor) via email by the end of the marking period. The report should contain notes on particular strengths displayed as well as common errors or weaknesses. Constructive criticism of the question paper/mark scheme is also appreciated.
10. For answers marked by levels of response:

Read through the whole answer from start to finish, concentrating on features that make it a stronger or weaker answer using the indicative scientific content as guidance. The indicative scientific content indicates the expected parameters for candidates’ answers, but be prepared to recognise and credit unexpected approaches where they show relevance.

Using a ‘best-fit’ approach based on the science content of the answer, first decide which set of level descriptors, Level 1, Level 2 or Level 3, best describes the overall quality of the answer using the guidelines described in the level descriptors in the mark scheme.

Once the level is located, award the higher or lower mark.

The higher mark should be awarded where the level descriptor has been evidenced and all aspects of the communication statement (in italics) have been met.

The lower mark should be awarded where the level descriptor has been evidenced but aspects of the communication statement (in italics) are missing.

In summary:

- The science content determines the level.
- The communication statement determines the mark within a level.

Level of response questions on this paper are 2(a) and 4(d).

12. **Subject-specific Marking Instructions**

**INTRODUCTION**

Your first task as an Examiner is to become thoroughly familiar with the material on which the examination depends. This material includes:

- the specification, especially the assessment objectives
- the question paper
- the mark scheme.

You should ensure that you have copies of these materials.

You should ensure also that you are familiar with the administrative procedures related to the marking process. These are set out in the OCR booklet *Instructions for Examiners*. If you are examining for the first time, please read carefully *Appendix 5 Introduction to Script Marking: Notes for New Examiners*.

Please ask for help or guidance whenever you need it. Your first point of contact is your Team Leader.

## Question Answer Marks Guidance

| 4 | (a) Measure reduction of colour of bromine ✓ | 1 | Indicative scientific points may include:  
Initial rate  
- Evidence of tangent on graph drawn to line at  
  \( t = 0 \) s  
  AND gradient determined in range  
  \( 4 \pm 1 \times 10^{-5} \)  
- Initial rate expressed as gradient value with  
  units of mol dm\(^{-3}\) s\(^{-1}\), e.g. Initial rate = \( 4 \times 10^{-5} \) mol dm\(^{-3}\) s\(^{-1}\)  
  
Half lives and reasoned order of Br\(_2\)  
- Half life measured on graph OR within text  
  OR stated in range 180–200 s  
- Constant half life OR two stated half lives  
  within ±20 s  
  AND conclusion that Br\(_2\) is 1st order  
  
Determination of  \( k \) with units  
- Rate constant  \( k \) clearly linked to initial rate OR  
  half-life:  
  \[ k = \frac{\text{rate}}{[\text{Br}_2]} \]  
  OR  \( k = \frac{\ln 2}{t_{1/2}} \)  
-  \( k \) determined correctly from measured initial  
  rate or measured half life with units of  
  s\(^{-1}\), e.g.  \( k = 4 \times 10^{-3} \) s\(^{-1}\)  
  from initial rate of  \( 4 \times 10^{-5} \) mol dm\(^{-3}\) s\(^{-1}\) OR  
  \( t_{1/2} \) of 175 s  

| 4 | (b) Measure volume of CO\(_2\) (produced) ✓ | 1 |  

| 4 | (c) Concentration of HCOOH would be constant ✓ | 1 |  

### Level 3 (5–6 marks)
A comprehensive conclusion which uses quantitative data from the graph to correctly identify and calculate initial rate AND half lives and reasoned order of Br\(_2\) AND determination of  \( k \) with units

There is a well-developed conclusion showing a line of reasoning which is clear and logically structured. The working for initial rate, half life and order are clearly shown. Determination of  \( k \) is clear and correct.

### Level 2 (3–4 marks)
Reaches a sound, but not comprehensive, conclusion based on quantitative data from the graph. Correctly identifies and calculates initial rate AND half lives and reasoned order of Br\(_2\).

The conclusion has a line of reasoning presented with some structure. The initial rate and order is relevant and supported by correct evidence from the graph. There may be errors in the calculations which prevent the correct determination of  \( k \).

</table>
| Level 1 (1–2 marks) | Reaches a simple conclusion using at least one piece of quantitative data from the graph. Attempts calculation of initial rate OR half lives and reasoned order of Br₂.  

*The information selected from the graph is basic and communicated in an unstructured way. The calculations may not be clear and the evidence used from the graph may not be clearly shown.*
